

CRANE DE PANDA

Darwinists describe science as chance. They believe that chance works miracles and attempt to account for the perfections they encounter, the sublime life forms and grandiose civilizations, in terms of coincidence. They try to brand any other alternative explanations as unscientific. That is why they produce chance-based developmental chronologies and look in the fossil record for evidence to support them. Yet the way this desperate logic has been portrayed as “scientific” is the disgrace of the century. As with the 73-million-year-old panda skull pictured here, the science of paleontology reveals examples of living things that have never changed.
