

BROWN BEAR SKULL

The variety of life created by Allah is so glorious that it can be appreciated everywhere in the world. A single species will have countless sub-species, all with their own unique attributes. Examples of nearly all these forms, with all their features, are present in the fossil record. There are no intermediate forms of the kind evolution suggests must have existed, no semi-developed species that ever emerged, and there is no sign of the “common ancestor” that various species are claimed to be descended from. Yet species and even their sub-species manifest themselves in the most perfect states, identical to present-day life forms, in the fossil record. One such example is this flawless fossil skull of a brown bear, which dates back 8.9 million years—proof that this life form never changed, and never underwent evolution.
