Allah's Art of Detail 13/14

The Superior Detail in Taste Perception Cells

We can remember the flavor of a food we enjoyed ten days ago. If we eat it again, we can perceive the same taste once again and experience the same enjoyment, because in taste is not familiar. However, the tongue's taste cells are not the same as the ones that existed ten days ago. Every day our taste cells come into contact with actual foods that are hotter or colder than the body's temperature. That too, as we could from juice, thick coffee, or bitter papayafruit juice all damage these cells to some extent. But by the will, new cells mature in the taste buds to replace those that have completed their life's work.

Even if people are constant of them, their processes occur so quickly that the taste cells we use at dinner are not those we use at breakfast. And yet we do not imagine ourselves to be eating that food for the first time. We never confuse an apple's flavor, because every new cell contains exactly the same knowledge as the old cell. In fact, all of our cells are constantly being renewed, and yet we do not sense these changes shape and size. How does our sense of taste, how new cells never recall themselves to the wrong place, and thus everything always remains the same shape?

If the old taste cells were not renewed, we would be unable to taste anything. A delicious meal or a piece of wood would taste the same. We would forget what sweetness was and be ignorant of a piece of food were poisonous or rotten, for only specially created taste cells can initiate this superior process and blessing. In fact, Almighty Allah, the Creator and Lord of all things, has created these cells with a perfect memory and a subtle neural system. This and thousands of other similar blessings are His gifts, for He is generous to His servants, English intelligently, and is all-comprehensive. "Praise to Allah, who has created everything in the heavens and on Earth by His power. He is the All-Wise, the All-Knowing" [16:1].

The Skin: An Amazing Detail and Blessing

The skin is a flawless casing that gives us a regular appearance; one needs the continuous activity going on inside our bodies, and makes each one of our most important senses, circulatory channels, waste systems, heat and moisture detectors, and other manifestations of His arbitrary operation within it. The skin itself is both strong and elastic, two characteristics that are precisely mutually exclusive.

It covers an area of 2m² (77.5 ft²) and weighs 3 kg (6.6 lbs). Its cells live for about one week, after which they die and are replaced. During a person's life, 20 kg (44 lbs) of skin cells are manufactured. Every square centimeter of skin contains

with a perfect memory and a subtle neural system. This and thousands of other similar blessings are His gifts, for He is generous to His servants, English intelligently, and is all-comprehensive. "Praise to Allah, who has created everything in the heavens and on Earth by His power. He is the All-Wise, the All-Knowing" [16:1].

The skin is a flawless casing that gives us a regular appearance; one needs the continuous activity going on inside our bodies, and makes each one of our most important senses, circulatory channels, waste systems, heat and moisture detectors, and other manifestations of His arbitrary operation within it. The skin itself is both strong and elastic, two characteristics that are precisely mutually exclusive.

It covers an area of 2m² (77.5 ft²) and weighs 3 kg (6.6 lbs). Its cells live for about one week, after which they die and are replaced. During a person's life, 20 kg (44 lbs) of skin cells are manufactured. Every square centimeter of skin contains

more cells that permit touch perceptions and various tactile tasks, depending on their location. For example, when your hand comes into contact with boiling water, the receptors cause you to feel a sensation of heat and then one of pain. Some 30,000 receptors perceive heat; 1.5 million feel pain.

The perfect casing and special organs, which is unaffected by external factors and has numerous elasticity, can transmit messages from every

square millimeter to the brain and sense to the brain. In fact, it causes a network of nerves and blood vessels that is constantly being renewed. Allah has created this intricate system each person and endowed even its smallest part with wisdom. In particular, in this intricate that modern technology cannot produce a similar structure.

This flawless casing protects us, enables us to touch other things, and gives us a pleasing appearance. A perfect blessing and flawless detail, Allah, in His boundless knowledge, created it and then bestowed it upon us. "We Allah Who made Earth a stable home for you and the sky a dome, and formed you, giving you the best of forms, and provided you with great and wholesome things. That is Allah, the Lord of absolute will and a force far greater than all known worldly forces, could have brought them into existence.

Despite living in such an excellent and delicate sensitive system, human beings never feel any difficulty or concern, because the system's creation is flawless. And yet the majority of people are ignorant of these blessings. If one of them were renewed, they would not know how helpful they actually are and would become aware of the great compassion that had barely approached them. The important thing in the worldly life, which is no more than a test, is for people to be grateful as they enjoy His blessings and mercy and thank Him for them. One reason for our existence is to see who will appreciate these beautiful blessings and who will be heedless and ungrateful. Success believers need to know that only Almighty Allah can bestow these blessings; thus, they should be constantly grateful to Him for them. "Do the unbelievers not see that the heavens and Earth were once together and then We separated them, and that We made from water every living thing? We tell they do not believe!" [21: 30].

The Acorn's Astonishing Detail

Each atom consists of protons and neutrons bonded together in the nucleus, around which electrons revolve rapidly. Since the nucleus carries an electrical charge and the proton has a positive charge, the nucleus is positively charged. The electron, on the other hand, has a

negative charge opposite to the nucleus and attracts to the latter. In fact, it causes a network of nerves and blood vessels that is constantly being renewed. Allah has created this intricate system each person and endowed even its smallest part with wisdom. In particular, in this intricate that modern technology cannot produce a similar structure.

This flawless casing protects us, enables us to touch other things, and gives us a pleasing appearance. A perfect blessing and flawless detail, Allah, in His boundless knowledge, created it and then bestowed it upon us. "We Allah Who made Earth a stable home for you and the sky a dome, and formed you, giving you the best of forms, and provided you with great and wholesome things. "Do the unbelievers not see that the heavens and Earth were once together and then We separated them, and that We made from water every living thing? We tell they do not believe!" [21: 30].

The Perfect System That Preserves Scent

When you take a deep breath, you simultaneously perceive various smells, for example, from the coffee you are drinking, the food cooking in the kitchen, the flowers in the vase, and the smoke outside. And yet you perceive them all individually, because your nose can analyze each smell it detects in thirty seconds and thus can distinguish among 1,000 scents.

Messages arriving from billions of scents are transmitted within a matter of minutes to one of thousands of cells. The speed involved here is extraordinary. Several million pieces of data move from one cell to another in as little as one-thirtieth of a second, never making a mistake. These perceptions allow you to identify a smell very quickly. In addition, the identification and organization of the transmitted data further increases scent sensitivity. The distinguishing and recognition of smells further increases scent sensitivity in the nose (Bill Bryson, A Short History of Nearly Everything, p. 746).

A person that sees and appreciates His goodness by looking at such a creature and understanding that only He can create blessings and everything that exists. To that end, it is enough to reflect on just one feature. People are responsible for seeing the proofs we can believe them and realizing that Allah is the Lord of all that exists. "Although with insipience are they those who remember Allah [held] standing, sitting, and lying on their sides, and reflect on the creation of

the heavens and Earth. "The Lord, You have not created this for nothing. Glory be to Him" [Subhanu] to those that the probabilities of the First" [21: 19].

Who has created all things in the best possible way, in the most comprehensive way, the creation of humanity from clay?

13/14

at the same time does not prevent us from telling them apart, no matter how numerous they may be, we can distinguish one from another quite easily.

The fact that each person has such an amazing system may never have occurred to anyone. As a person feels nothing odd in recognizing the scent of a rose or coffee and may never have wondered about the difference between recognizing a particular fruit's smell. Yet the complex systems in the nose's olfactory area, which exist only because Allah wills it to and controls its flawless operation, make the possible through-out one's life. "That is the Knowledge of the Unseen and the Visible, the Almighty, the Most Merciful, He Who has created all things in the best possible way. He commemorated the creation of humanity from clay" [15: 26].

Allah's Art of Detail 14/14

The Pituitary Gland: Regulator of the Human Body

The brain contains a pea-sized organ that weighs around 0.5 grams (0.017 ounces) and, amazingly enough, supervises and regulates the entire body. Known as the pituitary gland, this most complex, flawless, and vital administrator discharges jobs to coordinate hormones and monitor each one, all of which have their own appointed tasks, without interruption.

We move our heads and arms, we hear, smell, speak, and touch all at the same time. We remember what people have said to us and analyze things. All of the activities that reach us and our movements take place by means of hormones. The pituitary gland regulates hundreds of processes to take place simultaneously in the body, and without delay. There is no question of any hormone running late; being unable to transmit the message that reaches them, or, apart from exception.

the pituitary gland, the most complex, flawless, and vital administrator discharges jobs to coordinate hormones and monitors each one, all of which have their own appointed tasks, without interruption.

The Amphipod: A Detail Living in the Ocean

Human beings cannot breathe oxygen dissolved in water or withstand the pressure under water, which is some 1,000 times heavier than air. However, the pressure rises rapidly the further down one goes, approximately 1 atmosphere for every 10 m (33 ft) of depth. When one descends to 120 m (394 ft) under water, the veins may collapse and the lungs contract to the size of a soda can. Thus, in the absence of man-made technology, human beings can live only on dry land.

Human beings are extraordinarily vulnerable to water pressure. However, there are other life forms on Earth that, thanks to their special equip-

ment, possess qualities that are far superior to those of human beings. For example, the Mariana Trench, the world's deepest point, is home to colonies of amphipods, which are shrimp-like invertebrate creatures. This area lies some 11.3 km (7 miles) below the ocean's surface. From the intense pressure at 4 km (2.5 miles), the average ocean

depth, is equivalent to that applied by the weight of fourteen cement trucks loaded with coconuts. This creature, about which almost nothing is known to us, can survive under even harsher conditions. The animal itself is unaware that it lives many kilometers below the surface of the ocean and can survive under a pressure that would kill a human being. The way that it remains alive at depths we cannot reach is one of the proofs that all living things, whether in the ground, in the depths of the ocean, or in the highest sky, are created through Allah's sublime artistry.

A person that sees and appreciates His goodness by looking at such a creature and understanding that only He can create blessings and everything that exists. To that end, it is enough to reflect on just one feature. People are responsible for seeing the proofs we can believe them and realizing that Allah is the Lord of all that exists. "Although with insipience are they those who remember Allah [held] standing, sitting, and lying on their sides, and reflect on the creation of

the heavens and Earth. "The Lord, You have not created this for nothing. Glory be to Him" [Subhanu] to those that the probabilities of the First" [21: 19].
