

GOLDAFFESCHÄDEL

As a basis for claiming that human beings are descended from apes, Darwinists point to the imitative ability of certain species of monkey. Monkeys are able to mimic actions and behavior they see, but this does not allow them to eventually evolve into human beings. If it did, then other species of animal also known to be intelligent should also have become possessed of human attributes. Parrots, for example, are also able to mimic human speech. Therefore, according to Darwinists' nonsensical claims, there must be a greater likelihood of parrots developing human speech. Countless findings, such as the 36-million-year-old monkey skull illustrated here, prove that living things have always remained the same, have never changed, and never developed into any other life form—and that it's meaningless to insist on such illogical claims.
